LITEPAPER / 01

Research before you decide.

A working MVP, a proposed community token and an evidence-led development plan.

The problem NOAH addresses

A rising chart does not explain demand quality, the ability to sell or the credibility of a project. NOAH brings market context, available risk checks and a practical research step into one workspace, with sources and dates.

What works today

Find the exact token. Search by name, ticker or address, then confirm the network and full mint. A familiar name, market cap or top search position is not proof of identity.

Understand the evidence. Review the selected market, price and volume, liquidity, available token controls and large-account evidence. A pool statistic is not the entire market.

Keep your reasoning. Save a research question and dated observations in the browser, then reopen and compare later. Public Scout does not require login, token purchase or a wallet.

What remains experimental

Coverage varies by token and provider. Very new, pre-migration and thin markets can lack usable data. Some checks describe permissions or sampled accounts without proving who controls liquidity or whether a project has genuine usage. Missing or stale evidence cannot establish safety.

Scout does not execute trades or guarantee an entry price, future winners or scam detection. No profitable predictive alpha has been established. Internal bot research is separate and provides no right to its profits.

Why a token is proposed

The planned NOAH token links community participation to the project. Advanced holder tools and Founding Access remain proposals requiring usable features, final eligibility rules and operating capacity. Free Scout remains available without purchasing the token.

Genesis previews, application goals and proposed airdrop places are distinct programs. An application is not an active benefit, token award or evidence that a cohort filled.

LITEPAPER / 02

Token rules. Cash reality.

Pump.fun is the selected launch route. No onchain issuance is verified in this edition.

Planned issuance and founder purchase

Name: NOAH. Symbol: NOAH. Network: Solana. Planned time: 31 October 2026 at 16:00 CDMX (22:00 UTC). This is an intended time, not a completed launch or a guaranteed transaction window.

Pump supplies the curve parameters and migration mechanics. The standard creation instruction does not define an arbitrary team/treasury/community split or a custom vesting schedule. Actual supply, decimals, authorities and fee treatment must be verified from the finalized transaction and accounts.

Founder purchase. Up to US$250 is planned for an initial purchase, with actual conversion and fees reviewed before signing. The number of tokens and percentage are variable. No purchase is verified here, and being first is not guaranteed by a prepared draft.

Holdings and locks. No extra private team allocation, treasury token reserve or community reward reserve has been approved and verified in this record. This does not prove zero team holdings. No lock or vesting is implemented; exact terms, compatibility, costs and separate approval would be needed.

The approved treasury policy

100% of creator fees received

Allocated to the NOAH project treasury, with a public use ledger.

This policy concerns the creator fee actually received by NOAH, not all trading fees, trading volume or token sale proceeds. It is a project policy; automatic treasury transfers are not configured. Revenue is contingent on actual activity, fee rules and collection.

Purchases in the curve and the token market capitalization do not automatically become development cash. Token reserves, cash balances, restricted rewards and uncollected fees must be reported separately.

Wallet disclosure

Founder-designated creator/project wallet:

BN94ha4vwze1rcFSxPgLKozoA4WhFNY74tLvwgcNSAoZ

The full address must match the actual signer/creator before issuance. All other controlled wallets and acquired holdings require reconciliation. Prior project payments from this wallet mean an empty new ledger cannot be treated as a zero opening balance.

LITEPAPER / 03

Build. Verify. Account for it.

Funding follows evidence. Roadmap items and budgets are planning proposals.

A staged development plan

Stage 1 / US$8k. Validate comprehension and repeat use. Proposed gates: 20 external trials, 10 reviewed research cases and 5 voluntary returns within 48 hours.

Stage 2 / US$52k. Strengthen Solana checks, reliability, saved evidence and cost controls. Proposed gates: 50 activated accounts and at least 20% seven-day return among accounts with a full observation window.

Stage 3 / US$180k. Deeper history, wallet relationships, change alerts and signals tested against baselines. Expansion depends on evidence, staffing and actual funding.

The initial US$60k target is included in the US$240k base plan. The estimated range is US$185k-US$295k. Timelines start when funded and staffed; these are not capital received, vendor quotes or guaranteed delivery dates. The existing budget includes founder operations and contingency; token inventory and liquidity are separate.

Accountability and verification

Record each reconciled receipt and expense with date, asset, amount, transaction reference, category and destination. The proposed monthly report adds available cash, obligations, restricted reserves, runway and delivered milestones. The public ledger starts as a template, not a verified balance or a complete historical account.

After issuance, publish the canonical mint, finalized creation receipt, actual creator, supply, decimals, authorities, fee recipient, initial holdings and any executed lock evidence. Buying a ticker alone is not identity verification.

Material limits

NOAH remains experimental. Provider failures, incomplete coverage, thin liquidity, concentrated holdings and security incidents can affect results and token value. Tokens can lose all value. There is no equity, engine-profit entitlement, guaranteed return or demonstrated predictive alpha. Technical and legal review is not represented as completed.
