LITEPAPER / 01

Research before you decide.

A working research MVP. A launched token. A development plan that still needs validation.

What NOAH is for

A price chart alone does not explain demand quality, the ability to sell or the credibility of a project. Scout brings market context, available risk checks and a practical next research step into one workspace, with sources and dates.

Identify. Find a token by name, ticker or address, then confirm the network and full mint. Names, market cap and search ranking are not proof of identity.

Understand. Review the selected market, price and volume, liquidity, token permissions and available large-account evidence. A pool statistic is not the entire market.

Remember. Save a research question and dated observations in this browser. Reopen and compare later. Public Scout requires no account, wallet or token purchase.

What remains experimental

Coverage and freshness vary by token and provider. Very new, pre-migration and thin markets can lack usable charts or risk checks. Permissions and sampled token accounts alone do not prove who controls liquidity, whether demand is organic or whether a project has genuine usage.

Scout does not execute trades, guarantee a fair entry price, identify every scam or predict future winners. A sale estimate does not simulate every holder selling or future liquidity changes. No profitable predictive alpha has been established. Internal bot research is a separate experiment.

The token and proposed holder tools

NOAH was created on Solana through Pump.fun on 31 October 2026. The product existed before the token. Proposed advanced tools and Founding Access still require usable features, final eligibility, funding and capacity. Launching the token does not activate those benefits.

Genesis, proposed airdrop places and user-research goals remain separate programs. An application is not an active benefit or a token award. Public Scout remains available without purchasing NOAH.

LITEPAPER / 02

The verified launch record.

Finalized transaction: creation and the founder initial purchase together.

Official Solana mint

BCPe7sWqEh9bT5eUiFZKWqzWLToR1cr6g7ikwjazpump

Actual launch. 31 October 2026 at 16:11:25 CDMX / 22:11:25 UTC. Finalized slot 463851877. Name and symbol: NOAH. Total supply: 1,000,000,000 tokens, 6 decimals, Token-2022.

Authorities and mode. Mint authority, freeze authority and token-metadata update authority are null in the verified mint account. The creation instruction identifies the expected creator wallet and has Mayhem disabled.

Initial founder acquisition. 84,603,487.442939 NOAH, or 8.4603487442939% of supply. CreateV2 and BuyV2 are present in the same successful finalized transaction.

Selected input and actual debit. The founder selected 2.6 SOL. Verified net wallet debit was 2.607917847 SOL, including purchase and account/network costs. The network fee was 33,688 lamports. A dollar value is not asserted from an undated exchange rate.

Verified creator and signer

What this record does not establish

The initial receipt does not prove the founder still holds the same amount, disclose every related wallet or establish an independently audited distribution. No project token lock or vesting receipt is verified by this edition. Team-controlled wallets and any future reward inventory still need reconciliation.

The Pump curve and migration mechanics are protocol-defined. This document does not allocate arbitrary 60/20/20 shares to team, treasury or community. Remaining protocol balances are not the same as development cash or an immediately tradable public float.

Token identity and transaction success do not establish safety, price support or future returns. The token provides no equity or entitlement to the trading engine's profits.

Build. Verify. Account for it.

A treasury policy and staged plan, distinct from token price and trading volume.

100% of creator fees received

Allocated to the NOAH project treasury, with a public use ledger.

This founder-approved policy covers creator fees actually received by NOAH, not all platform fees. Automatic treasury transfers are not configured and no reconciled fee revenue is asserted. Curve purchases and market capitalization do not automatically fund development.

Proposed development stages

US$8k / validate. Test comprehension and repeat use. Proposed gates: 20 external trials, 10 reviewed research cases and 5 voluntary returns within 48 hours.

US$52k / strengthen. Improve Solana checks, reliability, saved evidence and cost controls. Proposed gates: 50 activated accounts and 20% seven-day return among accounts with a full observation window.

US$180k / deepen. Historical evidence, wallet relationships, change alerts and signals tested against baselines. Expansion depends on actual funding, staffing and evidence.

The first US$60k is included in the US$240k base plan. Estimated range: US$185k-US$295k. Dates start when funded and staffed. These are planning estimates, not vendor quotes, funds received, delivery guarantees or spending approval. The budget includes founder operations and contingency; token inventory and liquidity are separate.

Accountability and open work

Reconcile each receipt and expense with date, asset, amount, transaction reference and category. The proposed monthly report adds cash, obligations, restricted reserves, runway and delivered milestones. The public ledger is currently a template, not a verified opening balance or a complete history of earlier project payments.

Remaining work includes controlled-wallet reconciliation, any approved lock, usable holder benefits, data reliability, independent evaluation, security and legal review. Provider failures, concentration and thin liquidity can affect results and token value. A token can lose all value.
